BRIEF INTRODUCTION

AI Software Engineer with 3+ years of experience building agentic AI platforms, distributed infrastructure, and data pipelines for production AI products. Designed systems serving 200+ users and 1,000+ devices, with a track record of turning manual workflows into automated, observable platforms that cut costs and accelerate delivery.

EXPERIENCE

AI Software Engineer, Jabil , Taipei/Taiwan , Jun 2026 - Present

Python / Golang / Next.js / Grafana / Airflow / Garage / Podman / Nginx / PostgreSQL

- Owned FW/SW infrastructure across 11 racks, including GitLab, JFrog Artifactory, and Jenkins, and built Grafana observability for server health, resource usage, and service status. Redesigned backups around a local S3 tier with AWS S3 offsite redundancy, cutting AWS costs by 70%, and replaced crontab jobs with Airflow DAGs for end-to-end visibility into backup status and failures.
- Architected and built an agentic harness platform adopted by 200+ technical and non-technical users, featuring Skills Store, OAuth-based MCP Gateway, RAG/Memory, Agent Orchestration, ACP/WebSocket Adapter, and per-user containerized sandboxes. Cut token waste by 90%, eliminated 1+ week of setup per user, and enabled architects and project leads to produce clearer architecture and requirements docs while giving engineering and support teams richer reference material.

AI Software Engineer, Ubiquiti , Taipei/Taiwan , Dec 2024 - Jun 2026

Python / Golang / Next.js / Grafana / Airflow / Kubernetes / Docker / Traefik / SeaweedFS / MongoDB / PostgreSQL

- Owned QA, EA, and GA test environments for Edge AI camera systems across 1,000+ devices, architecting a distributed CI/CD system with horizontally scalable daemons for device health checks, firmware updates, and parallel test execution; built a Docker MACVLAN virtual camera framework with ONVIF and RTSP to reproduce device and streaming failures, improving test determinism and enabling automated recovery.
- Architected and built an annotation and data versioning platform integrating CVAT, DVC, Rclone, and Kubernetes to automate data transfer, validation, versioning, and dataset preparation; processed 50GB+ daily, eliminated all manual transfers, cut preparation time by 1+ hour per batch, and raised data availability from 70% to 99%.
- Designed a monitoring and automation pipeline across six product lines, including Protect, Access, Drive, Switch, Connect, and Play, combining community issue tracking, GPU-accelerated thumbnail analysis, and hardware telemetry in Grafana; built agents to correlate signals and trigger alerts, cutting mean time to detection from hours to minutes, up to 360× faster.

AI Software Engineering Intern, Pegatron , Taipei/Taiwan , Jun 2024 - Nov 2024

Python / Next.js / Llama3 / FastAPI / LangChain / Milvus / MongoDB / MariaDB

- Developed scalable data pipelines for LLM retrieval, optimizing preprocessing with semantic chunking to improve recall by 5%.
- Developed multimodal agent response visualizations in React, rendering charts and key insights in the frontend.

Automation Engineering Intern, SWAG , Taipei/Taiwan , Sep 2024 - Nov 2024

Node.js / Cypress / GitHub Actions

- Developed a test automation framework integrated with GitHub Actions, reaching 70% test coverage and cutting manual testing effort by 50%.

Research Assistant, National Pingtung University , Remote , Apr 2023 - Mar 2025

Golang / Network Protocol

- Researched Time-Sensitive Networking multicast routing for deterministic Industrial IoT systems.
- Designed and open-sourced OMRSS, a multicast simulation framework: [helgesander02/OMRSS]

SIDE PROJECTS & HOBBIES

AI Dataset Faster Reviewer

Built a web-based service to accelerate dataset review and validation cycles, enforcing consistent quality standards while reducing review turnaround time.

3D Volume Rendering Product Demo

Built a web-based interactive 3D product visualization system that transforms 2D images into browser-renderable 3D assets, improving user engagement in e-commerce scenarios.
